Quantitative and Analytics **Practice**

Stakeholders at all levels can benefit from our quantitative and analytics practice when dealing with large, complex commercial casualty claims. We provide decision makers with the tools and analytics necessary to efficiently handle and resolve budget-impacting claims related to long-tail toxic tort and other matters.

When clients hire us, we undertake the following:

- Due Diligence and Claim Audit reviews: Ensure claim details and financials presented are in line with underlying documentation and policy provisions

- Customized Databases: Gather data from source documents tailored to your unique needs and policy conditions

- Long-tail Claim Allocations: Calculate policy-level exposure under any and all known triggers/methodologies and unique policy terms or conditions affecting the apportionment of dollars to coverage

- Dynamic decision-making models: Incorporate all known issues, assign probabilities, create dropdown options, and test the sensitivity of each input

- Expert Witness Testimony: Experience testifying in both deposition and trial settings

- Loss Portfolio Analysis: Determine company exposure across multiple loss types, policyholders, and policies

- Reconciliations and Data Analysis: Intake, validation, standardization, and reporting on large structured and unstructured datasets

We can also administer settlement agreements by reviewing costs and claims presented against the agreement, apportion resulting liabilities to coverage, invoice appropriate parties, handle payment procedures, perform standard and ad hoc reporting, and provide aggregate erosion tracking services.

Our extensive experience includes claims related to Asbestos, Hazardous Waste, Sexual Abuse and Molestation, PFAS, Concussive Injuries, Trademark and Copyright Infringement, Chemical Exposures,

Medical Device and Pharmaceutical Injuries, Construction Defect, and many other Mass Torts and Complex Claims.

For all your claims analytics and quantitative needs, hire MDD.
